COMBIVERT H6

Multi Axis Drives

Karl-Ernst Brinkmann started his own success story with six employees.

Based on continuous growth, KEB has expanded into a medium sized company with 1,200 employees. We have remained an owner-managed company in its second generation, which is a source of pride for us. Structured growth for 40 years, a strong connection to our home base Barntrup and the East Westphalia-Lippe (OWL) economic region: Reliability creates trust - also in our role as an employer. Long-time employees impressively document the close connections to the company, our suppliers, partners and customers.

For 40 years Karl-Ernst Brinkmann and its staff has developed mechanical and electronic power transmission products. The long experience gained working in collaboration with our customers has now been reflected in controls.

We are in good shape for the future. As a result, our nine subsidiaries and production sites in the world markets of Europe, North America and Asia work with centralized data management and state-of-the-art development environments for hardware and software design. This is not the end of the story; it's just the beginning!

From more than 30 years of experience with electronic drive technology, sophisticated control algorithms for all common motor versions have been developed. Based on our extensive experience on single inverter and servo drives, we are now pleased to offer the KEB COMBIVERT H6, the complete drive solution for machine automation.

KEB COMBIVERT H6 has integrated all the experiences in one device with new control and communication technology, perfect adaptable to machine builder requirements.

The modular drive technology: KEB COMBIVERT H6

KEB COMBIVERT H6 is the new product family for multi-axis solutions with the following modular components:

- power supply
- active front end - power supply and regeneration
- single-axis drive units
- double-axis drive units
- 24 V DC-supply unit
- embedded IEC 61131-3 control unit
- fieldbus adaptation
- multi-encoder-interface
- 24 V brake control
- integrated safety system

Features and benefits at a glance:

- space-saving design of a multi-axis drive system
- load share via protected DC bus link
- significantly reduced wiring and installation
- integrated Soft-PLC-, Motion- and NC- control
- integrated 24 V DC supply
- standardised connection technology simplifies handling
- integrated two-level safety systems
- innovative central cooling solutions for heat dissipation outside the control cabinet
- improved quality and lifetime by means of active DC-bus capacitor cooling
- central operation concept for the complete system
- standardized programming tools with diagnostics

The integrated Embedded IEC 61131-3 control unit can be used as PLC (**BASIC**) **B**, Motion Control (**PRO**) **P** and NC Control (**ADVANCED**) **A** for the coordination of linked motions in machines and systems.

The integrated Ethernet interface connects with the host control level and the EtherCAT fieldbus master carries out the complete communication between the axes, sensors and devices in realtime.

In addition peripheral IPC-based BOX-PC or PANEL-PC are available with integrated touchscreen monitor in various performance classes and realtime capable Windows XP embedded operation system.

■ mounting dimensions for all module sizes:

Wide	50 / 100 / 200 / 300 mm
Height	407 mm
Depth - Flat rear	198 mm
Depth - Air cooled	295 mm

Air cooled or Flat rear

Depending on the installation requirements the KEB COMBIVERT H6 system is available for two heat-exchange solutions:

- Integrated air cooled design with forced ventilation
- Central heat-exchange Flat rear modules in combination with central heat sinks for liquid cooled plates.

The mechanical construction is based on basic units with Flat rear heat plates. Its central heat sink supports the direct transfer of the main power losses inside and outside of the control cabinet. Due to the standard mounting pattern with 50 mm hole distance, central heat sink of different widths are prepared for direct installation of the modules.

For best possible heat dissipation, we recommend push through heatsinks. Technical details and accessories are available.

Further customized versions are available on request.

Fast Ethernet communication

High speed bus allows precise control of multiple axes.
Isochronous control of up to 8 axes in cycle time of less than 250 μ s.

EtherCAT®

The KEB EtherCAT system bus offers the following advantages:

- standardised
- different master controls are available
- high speed (100 Mbit/s)
- unlimited number of nodes
- CAN over EtherCat protocol
- high market acceptance and presence
- direct integration of external KEB Remote I/O's or other devices

Typical controller data	single axis	double axis
Current controller cycle	125 μ s	250 μ s
Speed controller cycle	250 μ s	500 μ s
Standard cycle	250 μ s	500 μ s
Digital I/O cycle	250 μ s	250 μ s
Fast input cycle	100 μ s	100 μ s

Module width	Central water cooler part number	W [mm]	H [mm]	D [mm]	m [kg]
400 mm	04H6TFW-0400	486	457	32	21
600 mm	06H6TFW-0600	686	457	32	29
800 mm	08H6TFW-0800	886	457	32	37
1,000 mm	10H6TFW-1000	1,086	457	32	45
1,200 mm	12H6TFW-1200	1,286	457	32	53

H6- Control unit

Embedded Controls with the high-performance CPU's (32bit RISC / 200MHz / FPU). They are programmable in IEC 61131-3, include an EtherCAT fieldbus master for applications with PLC, Motion Control and NC-functionality.

The Ethernet interface and the local RS232/485 interface provides universal connectivity for host controls, user menu / HMI and external sensors or devices. Connection to higher fieldbus layers is carried out by means of pluggable fieldbus cards. Currently Profibus, CAN, Interbus and soon Profinet are supported.

Furthermore two optional sockets for the two channel Multi encoder system integrate more position feedback devices into the automation system.

CONTROL SUPPLY UNIT

The 50 mm CONTROL SUPPLY UNIT is the highly efficient solution for PLC, Motion Control and integrated 24 V DC supply - containing the 24 V supply module and the Embedded Control, guarantees a further size reduction of the control cabinet.

CONTROL SUPPLY UNIT		Control unit / 24 V DC-supply unit with EtherCAT Master

24 V DC supply module

The central control voltage supply unit generates constant 24 V DC for the internal power supply of the axis modules.

The double feed from the DC bus and, additionally from the 1/3-phase mains input ensures an uninterruptable operation of the control voltage and bus communication even with disconnected power units. In addition, a controlled deceleration at the drive axis is ensured when the mains supply is down.

Besides the digital outputs, the maximum current of 25 A can usually directly supply several permanent magnet or spring applied brakes of the connected motors. Certainly, the module can be integrated into the two-channel error bus.

Supply unit with B6 rectifier

The central supply unit with controlled rectifier provides power to the drive system via the DC-bus and buffers partly the regenerative energy in the DC-bus capacitors, which accounts for approx. 1/3 of the total system. The standard internal braking transistor (GTR7) gives the option to connect a braking resistor directly for dynamic braking. The internal two-channel error bus and the system bus fully integrate the units into the fieldbus and control system.

Technical data for 2/4-pole motors; other number of poles or special motors: adapt supply module for DC-current. Mains choke with $u_k = 4\%$ assumed.

Mains chokes

The KEB COMBIVERT H6 uses a single choke from our standard Z1B04 range on the input. This will give a $u_k = 4\%$. Size selection is related to the average input current and peak load characteristic of the multi axis system.

Mains choke	I_n	I_{max}	L	W	H	D	m

Line filter

Compliance with the international standards for industrial and residential areas requires the use of EMC filters. In the **KEB COMBIVERT H6** modular system, they are installed centrally, above of the supply unit. The sizing of the modules according to EN 61800-3 environment C1 and C2 are typically based on 4 drive axes with a total motor cable length of 300 m.

Line filter	I_n	I_{Lk50}	I_{Lkmax}	P_d	W	H	D	m

AFE supply units

The sinusoidal regeneration uses the AFE and charging unit in combination. This offers a technically advanced alternative to the standard rectifier power supply, ideal for solutions requiring high regenerative performance. The charging unit takes control of the power contactor after the DC bus is fully charged.

The boost converter of this power supply unit maintains the DC bus voltage on an adjustable level i.e. at 650 V DC, which can be used to optimize motor sizing. A brake transistor (GTR7) is integrated.

AFE filters

In applications with high or continuous regenerative power, the energy provider requires a low ratio of harmonics (THD value) at the power supply unit.

The AFE-supply / regenerative modules of the KEB COMBIVERT H6 system have to be used with properly designed AFE-filters for sinusoidal regeneration operation. Depending on the application, these filters are designed for 100 % or 60 % regenerative duty cycle.

Accessories	AFE filter	I_n 100 %	W	H	D	m

Single-axis and double-axis drive units

- DC supply with internal fuses in both DC conductors
- External 24 V DC supply
i.e. for the internal switching power supply unit and the direct DC supply of a 24 V motor brake
- Internal controlled voltage sources, independent from DC-bus voltage

Drive units – control terminals

- **EtherCAT system bus**
realtime data transfer offset- and actual values between IEC-controller and drive modules
- **Two-channel error bus**
Channel-1: error output of the connected DC bus members
Channel-2: charging status of the DC bus of the supply unit
- **Diagnose interface**
RS232 / RS485- Interface to connect service tools and displays
- **Digital I/O**
4 digital inputs (IEC 61131-1)
4 digital outputs (High Side Driver, no relays, short circuit protected)

Drive units - software communication

- CiA402 - Cyclic synchronous position mode
- CiA402 - Cyclic synchronous velocity mode
- CiA402 - Cyclic synchronous torque mode

Implementation in accordance with ETG Implementation Guideline for CiA402 drive profiles

Driver for 3S – Softmotion and NC for KEB COMBIVERT H6 (based on Cyclic synchronous position mode)

Motor control features

Operation of synchronous and asynchronous motors

- Sensorless control of synchronous motors (S.C.L.)
- Sensorless control of asynchronous motors (A.S.C.L.)
- Rotorposition detection by HFI (high frequencs injection) at standstill
- Field weakening for synchronous motors (enhanced functionality)
- High torque and speed accuracy with and without encoder system

Multi encoder system

Various motor designs and application requirements define the type of encoder system.

This fixes the type of encoder feedback inside of drives.

To increase flexibility KEB COMBIVERT H6 has integrated these requirements in one hardware solution, simply adjustable via software.

The Multi encoder interface provides two channels, selectable for the following feedback types

- Resolver
- Incremental TTL
- BISS
- SSI
- SinCos
- Endat 2.1
- Endat 2.2
- Hiperface

In addition to the installation inside of the drive axis the feedback card could be used inside of the KEB COMBIVERT H6 control unit to extend the inputs for externally placed encoder systems.

Projected safety functions in KEB COMBIVERT H6, DIN IEC 61800-5-2

Drive modules with integrated safety systems

Depending on the application the design of safety related equipment demands different concepts, which are more and more supported by drive based safety functions. The axis modules of the KEB COMBIVERT H6 series can be equipped with scaleable safety functions:

■ Standard

non safety plug-in module for
controller enable, brake release and 24 V output / 100 mA

■ Safety-type 1

Plug-in module 1 for **single and double axis drive units** with safe shutdown of the drivers power supply operated only by hardware. The certification of the functions Safe Torque Off (STO) and Safe Brake Control (SBC) will be according to ISO 13849, Performance-Level e / IEC 62061, SIL3.

■ Safety-type 2

Plug-in module 2 for **single axis drive units** with safe inputs and safe shutdown operated via redundant micro-controller configuration, provided with the main functions, e.g. safety type 1 and two additional selectable functions according table page 16 - module 2.

- Safety functions according to IEC 61800-5-2 require a two channel encoder system, i.e. SIL certified SinCos or approved KEB motors with resolver.

A safety fieldbus based on EtherCAT (FSoE) is under development.

Description:

PL	=	Performance level
SIL	=	Safety Integrity Level (IEC 61508)
Module 2	=	STO/SBC and two more programable functions, adjustable with the safety programming tool in KEB COMBIVIS 6 / KEB COMBIVIS studio 6
X	=	fixed function
(x)	=	parameterizable function

KEB COMBIVIS 6

KEB COMBIVIS 6 - the new main tool for operation, display, parametrizing and diagnostics. It's a new system with a ".net" based architecture with a lot of available features and ready for future extensions.

Drive settings, application orientated parameter selection in work lists, analysis of the load and motion profiles or signal analysis- with the 16 channel oscilloscope - all in one tool.

Free software download under www.keb.de or on the DVD with complete documentation for a service fee under part number CDSW010-0100.

KEB COMBIVIS studio 6

offers a combination of parameterisation and programming of the drive and control technology designed by KEB. Based on the 3S-CoDeSys V3, the KEB COMBIVIS studio 6 incorporates an innovative and future oriented engineering platform, performing standard PLC tasks as well as operating highly dynamic Motion and CNC applications.

Furthermore, the program supports the bus configuration (EtherCAT, CAN, etc.) and contains useful add-ons, e.g. the wizards for motor configurator or for pre-setting of servo motors.

Remote I/O system

The stackable input and output modules of the KEB Remote I/O system transfer the external process signals via the EtherCAT network to the control system integrated into the KEB COMBIVERT H6 or a host control system. The IP 20 highly integrated analog and digital modules are equipped with pluggable terminal strips. The rugged housings are reinforced with aluminium frames for direct shielding on the terminal.

System solutions

The embedded control provides a powerful and cost efficient platform for many automation tasks in machines and systems without an operating system, where all the controller performance is “free” for fast EtherCAT communication and operation of drive axis and/ or peripheral I/O’s.

The operator interface is supported by a wide range of HMI terminal solutions with touch screen panels.

KEB COMBIVIS studio HMI

The engineering software offers powerful graphic libraries, drag&drop handling and state-of-the-art HMI design features. The three level software licence structure - with BASIC and ADVANCED for the operating system Win CE and BASIC, PRO and ADVANCED for the operating system Win 32 serves different function levels.

COMBIVIS connect

The remote control software for the KEB automation solutions erases physical distances, reduce service travel and allows

- remote control of drives and controls
- remote activation
- software modification and updating
- PLC remote debug and automation devices
- preventive and predictive maintenance

KEB COMBICONTROL C6

In addition to the embedded control of the H6 series, we provide a wide range of efficient IPC-based control technology for high level automation and visualisation.

BOX IPC in combination with external monitors for separate installation or combined PANEL IPC with three controller performance levels are available with high resolution touch screen sizes from 6" up to 24" in 4/3 and 16/9 dimension.

Equipped with the Windows XP(e) operating systems, the KEB IPC-based control technology contains an integrated EtherCAT master for the realtime connection with the drive axis and peripheral KEB Remote I/O.

Servo motors TA series

Synchronous motors transform the electrical specifications into a powerful rotation. The motors are characterised by low inertia and high overload torque and optional also available with permanent magnet brake.

Pluggable terminals for power supply and feedback systems allow variable cable connection for 360°-turns.

The necessity of torque and speed adjustment is often the reason for direct use of gear motors. KEB TA servo motors are assembled in a kit for applications with shaft, hollow shaft, flange or foot mounting and axial or coaxial power flow - all direct connected without extra coupling. High overall efficiency, lifetime lubrication, universal installation positions and robust mechanics are further performance features of the entire series.
